  - Lighting
  - Installations
  - Trade fair coordination
  - Zero Waste

"We have optimum  
solutions for  
**your requirements.**"

## 01 System construction

Use of prefabricated, modular components that are assembled according to the principle of a building block system. This enables a high degree of flexibility in design and size, simple assembly and disassembly as well as reusability of the components. System construction is therefore a cost-efficient and sustainable solution for exhibition stands.

## 02 Mixed construction

Combination of the advantages of system construction and individual construction. Prefabricated, modular construction elements (system construction) are combined with customized, individual components (individual construction). The result is an exhibition stand that offers both the cost efficiency and flexibility of system construction and the unique and individual design of custom construction.

## 03 Individual construction

Customized and unique constructions designed and manufactured specifically for a particular application. Each part of the stand is individually designed and handcrafted, allowing for a high degree of flexibility and uniqueness in design and presentation. While this method tends to be more costly than modular systems, it often delivers a higher degree of originality and customizability.
